Device Monitoring and Alerting Platform

All-in-one device and infrastructure monitoring platform

What is MONX?

MONX (Monitor for Operating Networks) platform is designed to monitor IT Infrastructure, Web, Lab, other manufacturing devices, and instruments.

Key Benefits

There are many monitoring platforms available on the market however none of them provide cross platform compatibilities under a single console.

Deployment Options

Depending on the Client preference or Geo location needs, MONX can be deployed in a **Hybrid** or fully **Cloud-based** mode.

Indefinite Logging

Due to the certain business requirements, some of the companies require to have an **infinite logging collection availability** that can be used for DR or Justification Purposes.

Storage Flexibility

MONX platform provides options to integrate **Google cloud** or/an **on-site share** for log repository.

Centralized Monitoring

Monitor entire company in the **single dashboard**, it does not matter what the device stack or protocol stack you run.

Streamline Ownership

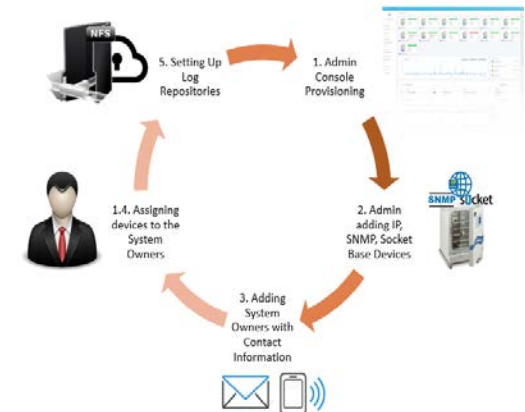

MONX allows to **define system owners** for the Alert Management. Alert Management also allows you to have a **multi-level ownership**.

Smart Alerts

MONX offers email, SMS **Alerts with Acknowledgement option** to eliminate unresponsive ownership responses.

MONX Operation

MONX allows to set and initiate alert triggers based on predefined condition changes such as uptime, process run, temperature, or pressure changes.
